```
Question 1
Correct
Mark 20.00 out of 20.00
```

Write a python program to calculate the length of the given string using recursion **For example:**

Test	Input	Result
length(str)	saveetha	length of saveetha is 8
length(str)	engineering	length of engineering is 11

Answer: (penalty regime: 0 %)

```
def length_recr(string,count):
    if string == '':
        return count
    return length_recr(string[1:],count+1)

def length(string):
    print(f"length of {string} is {length_recr(string,0)}")

str = input()
```

	Test	Input	Expected	Got	
~	length(str)	saveetha	length of saveetha is 8	length of saveetha is 8	~
~	length(str)	engineering	length of engineering is 11	length of engineering is 11	~
~	length(str)	Welcome	length of Welcome is 7	length of Welcome is 7	~

Question **2**Correct
Mark 20.00 out of 20.00

Rat In A Maze Problem

You are given a maze in the form of a matrix of size n * n. Each cell is either clear or blocked denoted by 1 and 0 respectively. A rat sits at the top-left cell and there exists a block of cheese at the bottom-right cell. Both these cells are guaranteed to be clear. You need to find if the rat can get the cheese if it can move only in one of the two directions - down and right. It can't move to blocked cells.

Provide the solution for the above problem Consider n=4)

The output (Solution matrix) must be 4*4 matrix with value "1" which indicates the path to destination and "0" for the cell indicating the absence of the path to destination.

Answer: (penalty regime: 0 %)

```

```
Question 3
Correct
Mark 20.00 out of 20.00
```

You are given an integer N. For a given N x N chessboard, find a way to place 'N' queens such that no queen can attack any other queen on the chessboard.

A queen can be attacked when it lies in the same row, column, or the same diagonal as any of the other queens. You have to print one such configuration.

Note:

Get the input from the user for N . The value of N must be from 1 to 8

If solution exists Print a binary matrix as output that has 1s for the cells where queens are placed

If there is no solution to the problem print "Solution does not exist"

For example:

Input	Result				
5	1	0	0	0	0
	0	0	0	1	0
	0	1	0	0	0
	0	0	0	0	1
	0	0	1	0	0

Answer: (penalty regime: 0 %)

SUBSET SUM PROBLEM

COUNT OF SUBSETS WITH SUM EQUAL TO X

Given an array arr[] of length N and an integer X, the task is to find the number of subsets with a sum equal to X.

Examples:

```
Input: arr[] = {1, 2, 3, 3}, X = 6
Output: 3
All the possible subsets are {1, 2, 3},
{1, 2, 3} and {3, 3}
Input: arr[] = {1, 1, 1, 1}, X = 1
Output: 4
```

THE INPUT

- 1.No of numbers
- 2.Get the numbers
- 3.Sum Value

For example:

Input	Result
4	1
2	
4	
5	
9	
15	
6	2
3	
34	
4	
12	
3	
2	
7

```

GRAPH COLORING PROBLEM

Given an undirected graph and a number m, determine if the graph can be coloured with at most m colours such that no two adjacent vertices of the graph are colored with the same color. Here coloring of a graph means the assignment of colors to all vertices.

Input-Output format:

Input:

- 1. A 2D array graph[V][V] where V is the number of vertices in graph and graph[V][V] is an adjacency matrix representation of the graph. A value graph[i][j] is 1 if there is a direct edge from i to j, otherwise graph[i][j] is 0.
- 2. An integer m is the maximum number of colors that can be used.

Output:

An array color[V] that should have numbers from 1 to m. color[i] should represent the color assigned to the ith vertex.

Example:

Answer: (penalty regime: 0 %)

```
class graphcoloring:
1 🔻
2 •
        def __init__(arr,color):
3
            self.colors = color*[0]
            self.arr = arr
4
5
        def graph_color_util(self):
6
            print("Following are the colors: ")
7
            for i in self.colors:
8
9
                print(i,"
10
11 •
        def graph_color(arr,m,colors):
12 ▼
            for row in len(arr):
```

```
13 | 1T arr[row][]
14 | 15 | 16 |
```

Syntax Error(s)

```
File "__tester__.python3", line 13
if arr[row][]
^
```

SyntaxError: invalid syntax
